BIOLOGICAL ACTIVITY OR INHIBITORS

Eupatilinthe has anti-proliferative effect in MCF10A- ras cells, is associated with its blockade of cell cycle progression which appears to be attributable in part to inhibition of ERK1/2 activation. [1] Eupatilin attenuates bile acid-induced hepatocyte apoptosis by suppressing bile acid-induced kinase activation, it might be therapeutically efficacious in a variety of human liver diseases associated with cholestasis. [2] Eupatilin and jaceosidin have effects on cytochrome p450 enzyme activities in human liver microsomes, have potential pharmacokinetic drug interactions in vivo due to inhibition of CYP1A2 and CYP2C9. [3] Eupatilin is a potent anti-atherogenic agent that inhibits PDGF-BB-induced proliferation and migration in HASMCs as well as aortic sprouting, which is likely mediated through the attenuation of PI3K, MKK3/6, and MKK4 activation. [4] Eupatilin suppresses oxidative damage and reciprocally enhances extracellular matrix production in articular chondrocytes, making eupatilin a promising therapeutic option for [5] Eupatilin improves the acute hepatic IRI by reducing inflammation and apoptosis, it is a [6] Eupatilin protects against tumor necrosis factor- α -mediated inflammation in human [7] Eupatilin induces Sestrin2-dependent autophagy to prevent oxidative stress.
