### BIOLOGICAL ACTIVITY OR INHIBITORS

Cinnamic acid is an effective anticancer and antioxidant constituents of traditional Chinese herbal medicines of Xuanshen (Radix scrophulariae), it can serve as protective

agents in cancer prevention and treatment.

Cinnamic acid induces cytostasis and a reversal of malignant properties of human tumor cells in vitro, the anti-tumor activity of cinnamic acid may be due in part to the inhibition of protein isoprenylation known to block mitogenic signal transduction, suggests that cinnamic acid as a new member of the aromatic fatty acid class of differentiation-inducers

with potential use in cancer intervention.

Cinnamic acids, one type of secondary plant substances found in detritus, inhibit feeding by detritivores, this inhibition occurs at concentrations found in nature and may be a major

effect, it has likely phytotoxic.

Cinnamic acid potentially can act as an in vivo modulator of the synthesis of phenylpropanoid pathway enzymes although it is not yet fully possible to rule out less specific inhibitory effects.

Cinnamic acid, 4-hydroxycinnamic acid and 4-methoxycinnamic acid strongly inhibit the diphenolase activity of mushroom tyrosinase and the inhibition is reversible, the IC 50
